

The AI stack, top to bottom

One request, and every layer it passes through.

WHO IS INVOLVED

Model provider — Trains it, owns the weights, sets the licence.

Model host — Runs someone else's model and sells access.

WHAT GOES WRONG

Hallucination — Confident, plausible, wrong — and indistinguishable from correct output, because truth is not a quantity the model computes.

HOW YOU KNOW

Evaluation — A repeatable test. The only thing that turns “it seems better” into a claim someone else can check.

Almost everything people attribute to “the AI” — that it remembers, searches, runs code, asks permission — belongs to the harness, not the model.
